

Genome-wide Analysis of Fis Binding in *Escherichia coli*

Indicates a Causative Role for A-tracts

Byung-Kwan Cho, Eric M. Knight, Christian L. Barrett, and Bernhard Ø. Palsson

Department of Bioengineering, University of California-San Diego, 9500 Gilman Drive,
La Jolla, California 92093-0412

Supplementary Methods

Whole genome-tiled microarray analysis. Cy5 and Cy3-labeled 9-mers (TriLink Biotechnologies) were diluted to 1 OD in 42 μ L of random 9-mer buffer (125 mM Tris-HCl (pH 8.0), 12.5 mM $MgCl_2$, and 0.175% β -mercaptoethanol). 1 μ g of the amplified IP or mock-IP DNA were added into 40 μ L of Cy5 or Cy3-labeled 9-mer solution in 0.2 mL thin-walled PCR tubes, respectively, and the final volume was made up to 80 μ L using ddH₂O. The samples were denatured in a PCR machine at 98 °C for 10 min and then quickly chilled in an ice water bath. 20 μ L of 50x dNTP mix solution (10 mM Tris-HCl (pH 8.0), 1 mM EDTA, 10 mM dNTP, and 100 U Klenow fragment) was added into the samples. The samples were incubated at 37 °C for 2 hr in a PCR machine (light sensitive) and then the reactions were stopped by the addition of 10 μ L of 0.5 M EDTA. The labeled samples were precipitated by adding 11.5 μ L of 5 M NaCl and 110 μ L of isopropanol. After incubation for 10 min in a dark room, the samples were centrifuged at 37,000 \times g for 10 min and rinsed with 500 μ L of 80% ice-cold ethanol. The samples were dried for 5 min in a Speed-Vac using low heat and protection from light. The dried pellets were rehydrated in 25 μ L of ddH₂O and the A₂₆₀ of each samples were measured to determine DNA concentration. Typical yields ranged from 10~30 μ g per reaction. 13 μ g of the both IP DNA (Cy5) and mock-IP DNA (Cy3) were combined into a single 1.5 mL tube. The combined contents were dried in a Speed-Vac on low heat and resuspended in 10.9 μ L of ddH₂O. Using the NimbleGen Array Reuse kit, 19.5 μ L of 2x hybridization buffer, 7.8 μ L of hybridization component A, 0.4 μ L of Cy3 CPK6 50-mer oligo and 0.4 μ L of Cy5 CPK6 50-mer oligo were added to each sample. The samples were incubated at 95 °C for 5 min and immediately transferred to 42 °C sample block in the MAUI hybridization unit (BioMicro Systems). The samples were loaded using the pipette supplied with the MAUI Station and hybridized overnight. After washing with washing buffers, the arrays were immediately scanned using Axon Scanner (model 4000B).

Data Processing. All ChIP-chip datasets showed high reproducibility (**Supplementary Figure S2**). The raw signals from the scanning were normalized by the Tukey bi-weight mean. Since ChIP-chip analysis is a two-color array with the reference on the array, the data is therefore thought of as a stand-alone experiment. The Tukey bi-weight function is used to account for differences in the dyes on the array, whereas RMA is used to account for differences between arrays so that the chips can be compared. The \log_2 ratio of Cy5 (IP DNA) to Cy3 (mock-IP DNA) for each point was calculated from the scanned signals. Then, the bi-weight mean of this \log_2 ratio was subtracted from each point. The each \log_2 ratio from triplicate samples was then averaged and the Fis-binding sites were identified using mpeak program (<http://www.stat.ucla.edu/~zmdl/mpeak/>). All signals can be downloaded from our website (<http://systemsbiology.ucsd.edu/publications>). Genome-scale data was visualized using NimbleGen's SignalMap software, and most other analyses were performed with Matlab version 6.5 and Microsoft Excel software.

Supplementary Table S1. Transcriptome analysis and genome-wide Fis-binding sites. "bnum" indicates Blattner number. "TU" indicates the current transcription unit of *Escherichia coli* obtained from EcoCyc database (Keseler et al. 2005). "Strand" shows the transcription direction (+: Watson strand, -: Crick strand). In "Call" column, S indicates the genes differentially expressed between parental strain and *fis* deletion mutant strain (FDR 1% = 0.0021 (aerobic), 0.0024 (anaerobic); Anova 1% = 0.0001). Fold ratio indicates the log₂ values of expression profiling. In "Regulation" column, the numbers (1,2,3,4, and 5) indicate the genes directly regulated by Fis bound in IG1 region, the genes directly regulated by Fis bound in ORF, IG2 region, the genes indirectly regulated by Fis, and silent genes, respectively. RNAP, σ^{70} and Fis-binding category indicate the bindings of each proteins.

bnum	Locus	TU	Strand	Call		P-value		Fold ratio		Regulation	RNAP	σ^{70}	Fis-binding Category
				Aerobic	Anova	Aerobic	Anova	Aerobic	Anaerobic

Supplementary Table S2. Fis-binding sites identified by genome-wide ChIP-chip analysis. Numbers “1” and “0” in columns 3, 7, 8, 12, and 13 denote the presence and absence of the binding peak, respectively.

bnum	Gene	Promoter		Adjunct gene		ChIP-chip		Peak probe position		Ratio	RNAP	S70

The columns “Peak Start” and “Peak End” were obtained from NC_000913 build of the *E. coli* MG1655. The column “Type” indicates where Fis-binding sites are located relative to the known gene annotations. The “ChIP-chip” and “qPCR” columns indicate the level of enrichment ratio (\log_2 ratio) obtained from Fis ChIP-chip and the quantitative PCR, respectively. The data in the “ChIP-chip” and “qPCR” columns are plotted in the **Fig. 2C**. “NA” indicates “not available”.

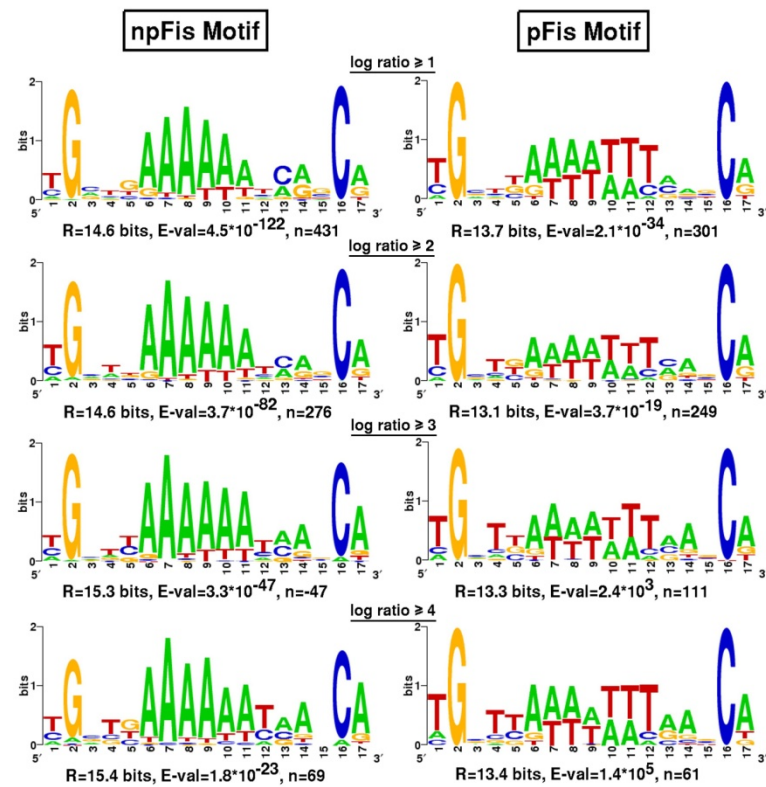

Supplementary Figure S1. Fis bindings on all of rRNA promoter regions.

Supplementary Figure S2. Reproducibility of Fis ChIP-chip.

Supplementary Figure S3. The most significant non-palindromic (npFis) and palindromic (pFis) motifs found in the chromosomal sequence regions under the Fis ChIP-chip peaks with increasingly stringent log ratio cutoffs.
